Data:

The data come from the United Nations Digital Library voting database, which records every country's vote on each General Assembly roll call.

Network:

The nodes are countries. An edge connects two countries that often voted the same way (Yes, No, or Abstain) on contested roll calls, weighted by the share of shared votes on which they agreed. In R, I kept only contested votes (at least 10% of voters in the minority), removed countries that no longer exist, and kept each country's 10 strongest ties. Colors show groups found with the Louvain method.

What stands out:

The Western group (the US, Canada, Europe, Japan, and a few partners) is tightly connected but has few ties to the rest of the Assembly. A handful of bridge states (Armenia, Nauru, Kiribati, Serbia, Cyprus, and Palau) link it to the other groups. Closer dots vote more alike, but exact distances aren't meaningful, and the groups shift somewhat with my cutoffs.
